

## How Does MicroVas Therapy Work?

As you begin to feel the pulses of MicroVas therapy, your body will begin to relax.

By using a digital current source to stimulate neuromuscular contractions that drive the venous muscle pumps, MicroVas therapy improves blood flow and tissue oxygenation, which in turn helps stimulate angiogenesis (a healing and rebuilding mechanism) within the body. MicroVas therapy creates strong, yet relaxing, contractions in skeletal muscle which can benefit people with problems relating to muscle tone, disuse atrophy, tissue damage and/or strength.
